

Name: Class:

Interpret histograms

A pediatrician took the weight of all the children that visited her clinic in the month of October.

How many children are there in all?

Name: Class:

Interpret histograms

A pediatrician took the weight of all the children that visited her clinic in the month of october.

How many children are there in all?

The height of each bar shows the number of children in that range.

So, read the height of each bar from the graph.

Range	number of children
21-40	4
41-60	9
61-80	7
81-100	5
101-120	1
121-140	10

Add to find the total number of children whose weights were taken.

$$4 + 9 + 7 + 5 + 1 + 10 = 36$$

So, there are 36 children in all.
